

CiscoMaster™ UC Risk Checklist (Elite)

A high-level scan to identify hidden UC risks before they become outages.

SYSTEM HEALTH

■ Are your core UC systems running on supported versions?

Why it matters: Unsupported systems delay recovery and increase outage risk.

BACKUP CONFIDENCE

■ Are backups running AND proven to work?

Why it matters: Backups that aren't tested often fail when needed most.

DISASTER READINESS

■ Could your system be restored quickly today?

Why it matters: Recovery speed directly impacts business downtime.

SECURITY RISK

■ Are there expiring certificates or vulnerabilities?

Why it matters: These can silently break services or expose systems.

UPGRADE RISK

■ Would your environment survive an upgrade?

Why it matters: Hidden issues usually appear during upgrades.

VISIBILITY

■ Do you have clear system health visibility?

Why it matters: Unseen problems are not fixed until failure.

DOCUMENTATION

■ Is your UC environment clearly documented?

Why it matters: Lack of documentation slows recovery.

CiscoMaster Insight

"If you're not 100% sure about any answer... that's a risk."

What This Checklist Does NOT Show

- Hidden replication issues
- Upgrade blockers
- Misconfigured services
- Backup failures during restore
- Root cause risks

Most environments that pass this checklist still have 10–30 hidden risks.
