

CiscoMaster™ UC Risk Checklist

A quick scan to identify hidden risks in your Cisco UC environment before they turn into outages.

Prepared by WDC LLC

Infrastructure Lifecycle Governance

Use this checklist before an outage, before an upgrade, or before leadership asks why the UC environment is exposed.

Risk Color	Meaning	Recommended Action
 Green	Acceptable posture	Continue monitoring
 Yellow	Planning required	Create remediation plan
 Red	Immediate exposure	Prioritize corrective action

FIELD CHECKLIST

Use the Status column to mark Green, Yellow, or Red.

Add notes for evidence, screenshots, version numbers, or follow-up items.

Lifecycle & Version Risk

Why this matters: Unsupported or misaligned systems increase outage and upgrade risk.

Check Area	Key Question	Status	Notes
Core UC Systems	Are your core UC systems running on supported versions?		
Voicemail Platform	Is your voicemail platform aligned with a supported baseline?		
Messaging / Presence	Is messaging and presence compatible with your environment?		
Remote Access	Is remote access (edge) current and secure?		
System Alignment	Are all systems aligned and operating consistently?		

DR & Backup Readiness

Why this matters: Untested backups and unclear recovery plans lead to extended downtime.

Check Area	Key Question	Status	Notes
Backup Confidence	Are backups running and proven to work?		
Restore Confidence	Could you restore your systems successfully today?		
Backup Storage	Is backup storage available and functioning?		
Recovery Speed	Could key services be recovered within your business needs?		
Backup Survivability	Are backups protected from local site failures?		

Security & Exposure

Why this matters: Security gaps and expiring certificates can disrupt service or create risk.

Check Area	Key Question	Status	Notes
Certificate Health	Are certificates valid across your UC systems?		
Imminent Expiration	Will any certificates expire within the next 90 days?		
Secure Connections	Are secure connections and trust relationships working as expected?		
Access Security	Is your remote and user access securely configured?		
Known Vulnerabilities	Have known security issues been reviewed and addressed?		

Upgrade Readiness

Why this matters: Hidden issues often only appear during upgrades.

Check Area	Key Question	Status	Notes
Upgrade Readiness	Would your environment survive an upgrade today?		
Dependence Check	Are there dependencies that could block an upgrade?		
System Stability	Is your environment stable enough to handle change?		
Change Window	Do you have an outage window aligned with business impact?		
Recovery Plan	Do you have a plan if something goes wrong?		

CiscoMaster Insight

If you're not 100% sure about any answer... that's a risk.

Backups prove that files were copied. Restore testing proves that the organization can recover. Treat untested recovery as a business risk, not an engineering detail.

Next Steps

Score	Count your Red and Yellow findings by category.
Prioritize	Start with items that affect recoverability, supportability, or security.
Roadmap	Build a 30/60/90 day remediation plan.
Engage	Request a WDC UC Health Check for an independent, expert review.

Most environments that pass this checklist still have 10–30 hidden risks.

A full UC Health Check identifies exactly where and how your system could fail — before it does.
